

## Challenge 2021 Maths 2 solutions

- 1)  $\frac{28}{124} = 0.226 \text{ miles per minute (3sf)}$   
 $\frac{25}{113} = 0.221 \text{ miles per minute (3sf)}$   
 So Joseph cycled faster on average
- 2) 11.28p per kilowatt-hour
- 3) 33.36 psi
- 4) a) i)  $\frac{3x-1}{4}$   
 ii)  $\sqrt[4]{\frac{y^2}{4x^2}}$
- b)  $\sqrt[3]{1 - \frac{3}{P}}$
- c)  $33\frac{1}{2}$
- 5) £550
- 6) 3
- 7) a) 6554  
 b) 39801
- 8) 1:46pm
- 9) 11 litres of P and 8.25 litres of Q
- 10)  $x=15.6\text{cm}, y=9.42\text{cm}$
- 11)  $9\text{cm}^2$
- 12)  $14.2\text{cm}$
- 13)a) 3,5,8,4,1,2,7,6,9  
 b) If 4 then we need 3 additional digits that add to 26. But even if we take the largest (7,8,9) then we get only 24.  
 If 8 then the last digit could be at most 9 so the minimum sum for the 8 leftmost digits is  $45-9=36$ .
- c)
- | Leftmost digit | Possible lists (except for ordering of non-first letters) | Sum | Works?  |
|----------------|---|-----|---|
| 1              | 1   | 1   | No  |
| 2              | 2,9 (maximum)   | 11  | No  |
| 3              | 3,9,5; 3,8,6  | 17  | Yes   |
| 4              | 4,9,3,1; 4,8,3,2;<br>4,7,5,1; 4,6,5,2                     | 17  | Yes   |
| 5              | 5,1,2,3,6 is the only one                                 | 17  | Yes   |
| 6              | 6,1,2,3,4,5 (minimum)                                     | 21  | No (and nothing larger will either by the same reasoning) |
- d) Already know that it must start and end with 3,4,5 by using part c.  
 If 5 starts or ends then 1,2,3,6 are next to it in some order. But the options for 3 and 4 all include either 3 or 5.  
 For 3 and 4 we could have e.g. 3,8,6,2,9,7,1,5,4.
- 14)a) i) ACD=XAB and ABX=XDC by alternate angles.  
 AXB=CXD by vertically opposite angles.

All angles in the triangles are the same so similar.

ii) 135mm

iii)  $AX = 72\text{mm}$

$$AX^2 + BX^2 = AB^2 \text{ as required}$$

b) 44.78cm
