

Eton College King's Scholarship 2003 A solutions

- 1) a) 18cm
 b) 1.25 Australian dollars
 c) $x = 9, y = 12$
- 2) a) $COA = 180 - 2x$
 $COB = 180 - 2y$
 b) If $BAT = p$ then $BAO = 90 - p$
 OAB is isosceles so $AOB = 2p$
 Similarly to part a, do angles around O add to 360. So $(180 - 2x) + (180 - 2y) + 2p = 360$
 Which gives $x + y = p$
 c) 60°
- 3) a) 5050
 b) $\frac{n(n+1)}{2}$
 c) Series should read $2+5+8+\dots+2996+2999+3002$
 1,503,502
 d) i) $a+9d$
 ii) $a+(n-1)d$
 iii) n times the average of the first and last terms
 $n \times \frac{((a)+(a+(n-1)d))}{2}$
 $\frac{n}{2}(2a + (n - 1)d)$
- 4) a) i) $PQ = 4$
 ii) Area $OPQ = 4$
 iii) $OM = 2$
 iv) Area of shaded segment = $2\pi - 4$
 b) $3\pi - 2\sqrt{2}$
- 5) a) $t^4 + 2t^2 + 1$
 b) $(2t)^2 + (t^2 - 1)^2$
 $= 4t^2 + t^4 - 2t^2 + 1$
 $= t^4 + 2t^2 + 1$
 $= (t^2 + 1)^2$, as required
 c) $ABC = 90$ degrees by Pythagoras
 d) $o \times o = o$ so $t^2 \pm 1$ is even and $2t$ even.
 e) One of $t^2 - 1, t^2, t^2 + 1$ is divisible by 3 as they are consecutive integers.
 If $t^2 - 1$ or $t^2 + 1$ are divisible by 3 then we have our result.
 If it is t^2 that is divisible by 3, then t is divisible by 3 and also $2t$, hence result.

6) a)

b)

c)

d)

7)

$$\begin{array}{r} P Q R S \\ + T U V Q \\ \hline T U R Q W \end{array}$$

T = 1 as the highest carry-over is 1

Consider $P + T + \text{possible carry-over} = P+1$ or $P+2$.

We need a carry-over so $P=8$ or 9 , giving $U=0$ or 1 .

But 1 is already taken.

So **U = 0**.

$P = 8$ or 9 .

If $P = 8$ then there must have been a carry-over from $(Q + 0(U) + (\text{necessary}) \text{ carry-over from } R+V)$. But then Q must be 9 giving $Q + 0(U) + (\text{necessary}) \text{ carry-over} = 0(R)$.

However, R can't be 0 as $U=0$.

So **P = 9** and $Q + 0(U) + \text{possible carry-over}$ is less than 10 .

$R + V + \text{possible carry-over}$ must give a carry-over so that Q and R aren't the same.

$Q+1=R$.

$R + V + \text{possible carry-over}$ ends in Q .

$Q + 1 + V + \text{possible carry-over}$ ends in Q

$Q + 1 + V + \text{possible carry-over} = 10 + Q$

$1 + V + \text{possible carry-over} = 10$ so $V = 8$ or 9 .

V can't be 9 (already taken) so **$V=8$** and there is a carry-over from $S+Q$.

S and Q can be a maximum now of $7+6 = 13$ and a minimum of 10 .

So $W=2$ or 3 (0 and 1 are taken).

If S and Q are $6/7$, or $7/6$, then as $R=Q+1$ then R must be 7 or 8 .

But these are taken.

So S and Q are 5 and 7 and **$W=2$** .

$R = Q+1$ so **$Q=5$** (R cannot be 8 , which is taken), **$R=6$** and **$S=7$** .
